🔗 <https://github.com/upasanasd>

Dedicated M.Sc Data Analytics graduate with a focus on deep learning and machine learning, seeking a fast-paced role in AI or data science. Attempting to make the most of analytical abilities and support thoughtful decision-making in a forward-thinking team. Eager to use my practical experience and academic background to develop creative ideas.

EDUCATION

Digital University Kerala

Master of Computer Science with specialization in Data Analytics

Thiruvananthapuram, Kerala

Aug. 2023 – Present

Providence Women's College, Calicut University

Bachelor of Science in Mathematics

Kozhikode, Kerala

Jun. 2020 – Mar. 2023

Nanminda HSS

Science (Biology)

Kozhikode, Kerala

July. 2019 – Mar. 2020

PROJECTS

Audio Encryption using 2D and 3D Hyperchaotic maps

- The paper explores the use of 2D and 3D hyperchaotic maps as encryption frameworks for audio data security, providing a thorough analysis of their theoretical underpinnings and applications. By combining machine learning techniques and computational forecasting, we highlighted the challenges of predicting chaotic dynamics, demonstrating their complexity and unpredictability. Metrics such as entropy, correlation, NSCR, UACI, SNR, and PSNR confirmed the efficacy of both 2D memristive hyperchaotic maps and 3D hyperchaotic quadratic maps in encrypting audio data, supporting their applicability for high-security encryption.

Tribe sight

- The project implements a digital platform that delivers real-time information about the presence, type, and behavior of wild animals in specified areas with the goal of reducing accidents and fatalities in human-wildlife conflict zones. The project's objective is to use an edge device that interprets information from many sensors, including vibration and sound, to locally identify the presence of animals. In order to achieve a number of benefits, such as simple device powering, the removal of WIFI connection requirements, and the capacity to send anomaly or animal detection data via the fencing cable to a nearby station, we intend to install sensor units along each pillar of the solar fencing. The data can then be transferred to a cloud platform from there. This configuration guarantees that users get notifications and alerts on time..

Information extraction from finance-related documents | Natural Language Processing

- The project on information extraction from finance-related documents focuses on developing advanced algorithms and machine learning models to automate the identification, extraction, and classification of key financial data from diverse document types, including annual reports, financial statements, regulatory filings, and market analysis reports. The aim is to enhance the efficiency and accuracy of data processing in financial institutions by leveraging natural language processing (NLP) and named entity recognition (NER) technologies. By converting unstructured textual data into structured formats, this project seeks to facilitate faster decision-making, ensure compliance, and support detailed financial analysis, ultimately leading to more informed investment strategies and better risk management.

TECHNICAL SKILLS

Programming Languages: Python, HTML/CSS, R

Libraries: Pandas, Seaborn, Scikit-learn, NLTK, NumPy, Matplotlib, Regex, openCV, Tensorflow

Developer Tools: Tableau, Microsoft Power BI

SOFT SKILLS

Problem-solving abilities and statistical proficiency
Time Management
Communication Skill
Adaptability to Environment

LANGUAGES

English,Malayalam-Native
